We done the mySQL project using phpMyAdmin (via WAMP server) to manage the MySQL database and Visual Studio Code
to write the code and perform these operations.
First we connect visual studio and pymySQL.We created code with the following tasks:

1. Add Contact: Enter a contact's name, phone number, and e-mail into the database through your code.
2. Update Contact: Modify an existing contact's information.
3. Delete Contact: Remove a contact from the database.
4. View Contact: Show all contacts stored in the database.
5. Exit: Close the program.

First we connect python and pymySQL.

If we enter 1, it asks us to add details.

By entering 2, It asks us to update details.

By entering 3, it asks us to delete details.

By entering 4, It asks us to view details.

By entering 5, It will exit from the output.

It will create a table in pymySQL i.e., output/result.
